UAE Medical and Behavioral Paper 1

Contents

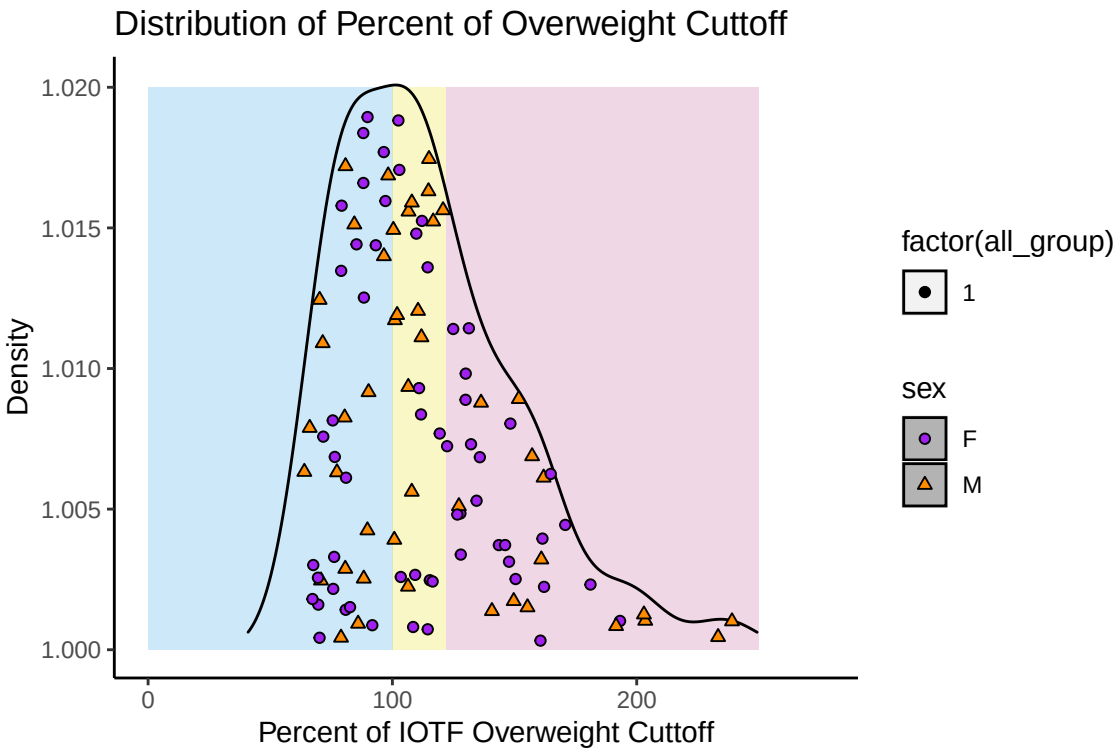
1 Measurement of Weight Status

We decided to use the International Obesity Task Force (IOTF) designation of weight status for the sample. They use smoothed, sex-specific BMI curves meant to match the the BMI cutoffs for overweight (OW; 25 kg/m^2) and obesity (OB; 30 kg/m^2) at age 18 yrs.

Rather than BMI-zscore or BMI-percentile, we chose to use percent of overweight cutoff because recent studies shows it has a tighter association with measured adiposity:

BMI % of overweight = $\frac{childBMI}{BMI\ at\ age-\ and\ sex-\ adjusted\ overweight\ cutoff} * 100$

<100 % - indicates child BMI is below the overweight cutoff for age and sex (i.e., has healthy weight) 100 % - indicates child BMI is the same as the overweight cutoff for age and sex >100 % - indicates child BMI is above the overweight cutoff for age and sex (i.e., has overweight or obesity)



Density plot of percent of overweight by sex. The shaded regions indicated those with healthy weight (blue), overweight (yellow), and obesity (red). The points show denisity of participants by sex (purple circles = female, orange triangles = males).

2 Participant Characteristics

Table 1: Demographic Characteristics by Weight Status

Characteristic	N	HW, N = 41	OW, N = 29	OB, N = 37

[1] n (%); Mean [Range]

2.1 Associations between Demographics and Percent of Overweight Cutoff

2.1.1 t-test for sex

```
    Welch Two Sample t-test

data:  IOTF_pOWcutoff by sex
t = -0.72449, df = 78.92, p-value = 0.4709
alternative hypothesis: true difference in means is not equal to 0
95 percent confidence interval:
 -20.558399   9.586342
sample estimates:
mean in group F mean in group M
       112.2213        117.7073
```

2.1.2 Correlation Matrix

Table 2: Correlations between percent of overweight cuttoff and demographic characteristics

	Age_yr	Father_ed	Mother_ed	IOTF_pOWcutoff
Age_yr				
Father_ed	-0.02			
Mother_ed	-0.2*	0.51*		
IOTF_pOWcutoff	0.26*	-0.07	-0.15	

Table 3: P-vales for the correlations between percent of overweight cuttoff and demographic characteristics

	Age_yr	Father_ed	Mother_ed	IOTF_pOWcutoff
Age_yr				
Father_ed	0.806			
Mother_ed	0.049	0		
IOTF_pOWcutoff	0.006	0.491	0.131	

Only child age was associated with percent of overweight cutoff - older children tended to have higher percent of overweight cutoff indicating older children were more likely to have overweight or obesity. There was no association with father or mother education level, which differs from finding in the US. Hip to waist ratio was also not associated with percent of overweight cutoff.

2.1.3 One-Way ANOVA for Income Categories

```
Anova Table (Type III tests)

Response: IOTF_pOWcutoff
            Sum Sq Df  F value Pr(>F)
(Intercept) 406511  1 282.6340 <2e-16 ***
Month_AED     1046  3   0.2424 0.8665
```

```
Residuals   136638 95
---
Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
```

There was no difference in percent of overweight by monthly income category.

2.1.4 Sensitivity Tests

Table 4: Linear Model: pOWcutoff - SES category + Maternal Education + Age + Sex

	b	se	t	p	
(Intercept)	71.310	27.957	2.551	0.012	
Month_AED25,000 - 55,000 AED	9.699	8.663	1.120	0.266	
Month_AED55,000 - 75,000 AED	19.268	16.747	1.150	0.253	
Month_AED> 75,000 AED	2.047	15.847	0.129	0.898	
Mother_ed	-1.654	1.254	-1.319	0.191	
Age_yr	4.239	1.464	2.894	0.005	***
sexM	10.293	7.621	1.351	0.180	

After controlling for family income, mother education, and child sex, child age was significantly associated with percent of overweight such that for each year older, the expected percent of overweight is predicted to increase 4.24%.

Table 10: Standard deviations for percent of overweight by absence vs presence of anemia

	x
N	36.117
Y	35.779

There were no difference in percent of overweight cutoff by presence/absence of Thyroid dysfunction or impaired glucose function. However, those with anemia tended to have lower percent of overweight. The mean with anemia was 101% indicating children were overweight on average. The mean for those without anemia were 123%, indicating the children were above the overweight cutoff.

IOTF_pOWcutoff	0.008	1.009	0.002	1.006	1.013	4.360	0.000	***

After controlling for family income, mother education, child age, and child sex, percent of overweight showed a trend-level association with number of family members with history of obesity. A child with 110% of overweight, compared to 100%, would have 1.08 times the odds of having an additional family member with a history of obesity.

5.2.4.1 Sleep Onset Delay After controlling for family income, mother education, child age, and child sex, percent of overweight was positively associated with sleep onset delay such that a child with 110% of overweight, compared to 100% of overweight, would be expected to have a sleep onset delay score that was 0.06 points higher (range of scores = 0 - 3). Additionally, age was positively associated with sleep onset delay such that each year older, the expected sleep disordered breathing score would be 0.12 points higher (range of scores = 0 - 7).

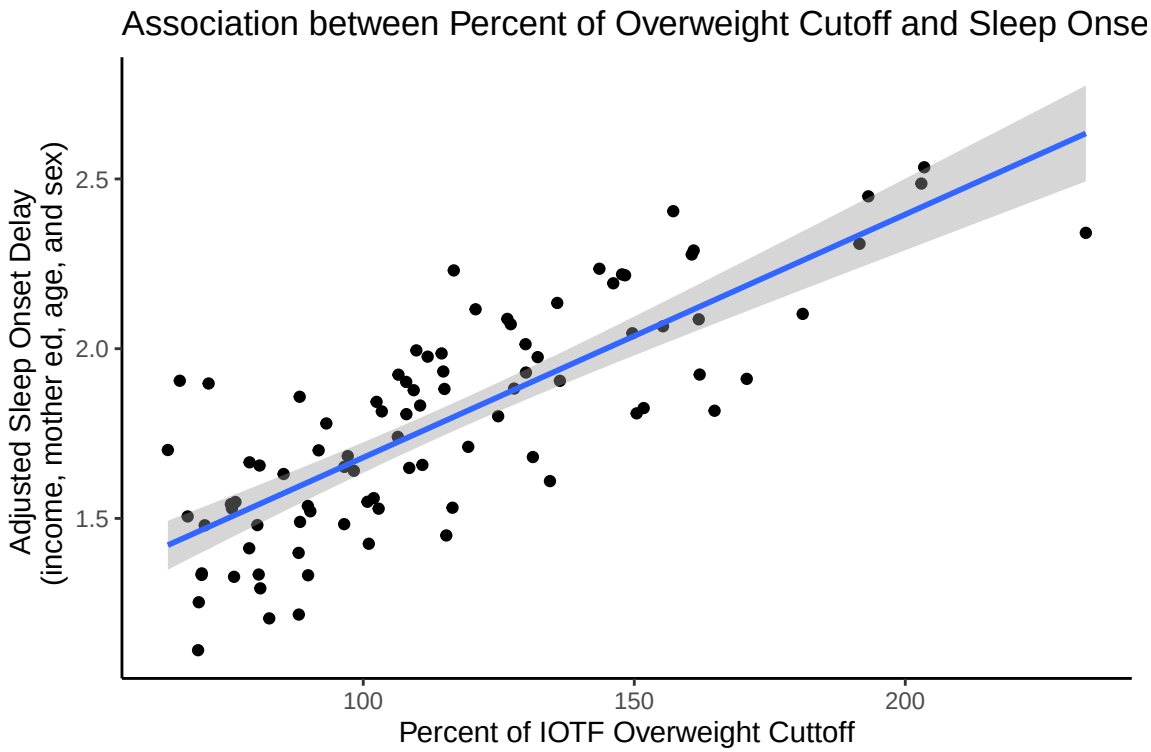

Table 25: Linear Model: Sleep Disordered Breathing - SES category + Maternal Education + Age + Sex + pOWcutoff

6.2.2 Peer Problems

Rather solitary, tends to play alone

Has at least one good friend - Reverse Scored

Generally liked by other children - Reverse Scored

Picked on or bullied

Gets on better with adults than with other children

When examining odds of experiencing elevated peer problems, controlling for family income, mother education, child age, and child sex, percent of overweight, there was a significant sex x percent of overweight interaction.

Table 31: Logistic Model: Peer Problems (Elevated vs Not) - SES category + Maternal Education + Age + Sex + pOWcutoff

Results are averaged over the levels of: Month_AED
Confidence level used: 0.95
```

For females, a female child with 110% of overweight cutoff would have 1.27 times the odds of experiencing elevate peer problems than a female child with 100% of overweight cutoff. There was no association between percent of overweight cutoff and odds of peer problems in males.

6.3 Prosocial

Considerate of other people's feelings

Shares readily with other children

Helpful if someone is hurt

Kind to younger children

Often volunteers to help others
