1 Measurement of Weight Status

We decided to use the International Obesity Task Force (IOTF) designation of weight status for the sample. They use smoothed, sex-specific BMI curves meant to match the the BMI cutoffs for overweight (OW; 25 kg/m^2) and obesity (OB; 30 kg/m^2) at age 18 yrs.

Rather than BMI-zscore or BMI-percentile, we chose to use percent of overweight cutoff because recent studies shows it has a tighter association with measured adiposity:

$$\text{BMI \% of overweight} = \frac{\text{childBMI}}{\text{BMI at age- and sex- adjusted overweight cutoff}} * 100$$

<100 % - indicates child BMI is below the overweight cutoff for age and sex (i.e., has healthy weight) 100 % - indicates child BMI is the same as the overweight cutoff for age and sex >100 % - indicates child BMI is above the overweight cutoff for age and sex (i.e., has overweight or obesity)

Density plot of percent of overweight by sex. The shaded regions indicated those with healthy weight (blue), overweight (yellow), and obesity (red). The points show density of participants by sex (purple circles = female, orange triangles = males).

2 Participant Characteristics

Table 1: Demographic Characteristics by Weight Status

Characteristic	N	HW, N = 41	OW, N = 29	OB, N = 37
Age_yr	107	11.85 [8.02 - 17.37]	12.84 [8.15 - 17.54]	13.69 [7.31 - 17.84]

2.1 Associations between Demographics and Percent of Overweight Cutoff

2.1.1 Correlation Matrix

Table 2: Correlations between percent of overweight cutoff and demographic characteristics

	Age_yr	Father_ed	Mother_ed	IOTF_pOWcutoff
Age_yr				
Father_ed	-0.02			
Mother_ed	-0.2*	0.51*		
IOTF_pOWcutoff	0.26*	-0.07	-0.15	

Only child age was associated with percent of overweight cutoff - older children tended to have higher percent of overweight cutoff indicating older children were more likely to have overweight or obesity. There was no association with father or mother education level, which differs from finding in the US. Hip to waist ratio was also not associated with percent of overweight cutoff.

2.1.2 One-Way ANOVA for Income Categories

Anova Table (Type III tests)

Response: IOTF_pOWcutoff

	Sum Sq	Df	F value	Pr(>F)
(Intercept)	406511	1	282.6340	<2e-16 ***
Month_AED	1046	3	0.2424	0.8665
Residuals	136638	95		

Signif. codes: 0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1

There was no difference in percent of overweight by monthly income category.

3 Medical Comorbidities

¹ Mean [Range]; n (%)

3.1 Association between Comorbidities and Percent of Overweight Cutoff

3.1.1 Correlation with Number of Comorbidities

Pearson's product-moment correlation

```
data: UAE_allDat$IOTF_pOWcutoff and UAE_allDat$nComorbid
t = 0.74423, df = 105, p-value = 0.4584
alternative hypothesis: true correlation is not equal to 0
95 percent confidence interval:
 -0.1190571  0.2587387
sample estimates:
      cor
0.07243876
```

There was no association between percent of overweight cutoff and number of comorbidities

3.1.2 t-tests for Presence/Absence of Comorbidities

Table 4: t-tests for percent of overweight by absence vs presence of medical comorbidity

	AbsentMean	PresentMean	t	df	pvalue	sig
VitD Deficiency	114.56	114.84	-0.02	9.25	0.984	
Anemia	122.62	101.12	3.01	81.89	0.004	**
Thyroid Dysfunction	113.40	118.44	-0.59	39.42	0.559	
Glycemic Status	112.51	120.43	-0.86	39.25	0.393	

There were no difference in percent of overweight cutoff by presence/absence of Thyroid dysfunction or impaired glucose function. However, those with anemia tended to have lower percent of overweight. The mean with anemia was 101% indicating children were overweight on average. The mean for those without anemia were 123%, indicating the children were above the overweight cutoff.

4 Family History

Table 5: Family History by Weight Status

Uncle	107	0 (0%)	1 (3.4%)	2 (5.4%)

¹ n (%); Mean [Range]

4.1 Association Between Family History and Percent of Overweight Cutoff

4.1.1 t-tests for Yes/Now History

Table 6: t-tests for percent of overweight by absence vs presence of family history

	No	Yes	t	df	pvalue	sig
Family History of Obesity	125.09	94.77	4.83	87.92	0.000	***
Family History of Eating Disorder	116.69	114.82	0.18	14.13	0.856	

There was no differences in percent of overweight for those whose families had a history of eating disorder (reported by parent). There was a significant difference in percent of overweight between families that reported a history of obesity ('Yes') and those who did not ('No'). Those without a family history of obesity had a mean percent of overweight equal to 94%, indicating the children had healthy weight on average. Children with a family history of obesity had a mean percent of overweight equal to 124%, indicating the children had overweight or obesity.

4.1.2 Correlations with Number of Relative Categories with History

Table 7: Correlations between number of relative categories with history and percent of overweight

	nFam_Obesity	nFam_EatingDisorder	IOTF_pOWcutoff
nFam_Obesity			
nFam_EatingDisorder	0.37*		
IOTF_pOWcutoff	0.43*	0.09	

Percent of overweight cutoff was not associated with reported number of relative categories with an perceived to have had an eating disorder but was associated with family history of obesity.

4.1.3 Sensitivity Tests

Table 8: Linear Model: Peer Problems (raw) - SES category + Maternal Education + Age + Sex + pOWcutoff

	b	$\hat{e}b$	se	$\hat{e}^{2.5}$ CI	$\hat{e}^{97.5}$ CI	z	p
(Intercept)	-0.180	0.835	0.577	0.266	2.558	-0.313	0.754
Month_AED25,000 - 55,000 AED	0.113	1.120	0.182	0.788	1.610	0.622	0.534
Month_AED55,000 - 75,000 AED	0.380	1.462	0.307	0.779	2.611	1.239	0.215

¹ Mean [Range]; n (%)

There were no differences by weight status.

6.1 Exploratory Sex x Percent of Overweight Models

6.1.1 Emotional Problems

Often complains of headaches

Many worries

Often unhappy, downhearted

Nervous or clingy in new situations

Many fears, easily scared

Table 14: Logistic Model: Emotional Problems (Elevated vs Not) - SES category + Maternal Education + Age + Sex + pOWcutoff

6.2 Conduct Problems

Often has temper tantrums or hot tempers

Generally obedient - Reverse Scored

Often fights with other children

Often lies or cheats

Steals from home, school or elsewhere

Table 15: Logistic Model: Conduct Problems (Elevated vs Not) - SES category + Maternal Education + Age + Sex + pOWcutoff

sexM:IOTF_pOWcutoff_c100	-0.030	0.970	0.014	0.942	0.997	-2.098	0.036 *

When examining odds of experiencing elevated peer problems, controlling for family income, mother education, child age, and child sex, percent of overweight, there was a significant sex x percent of overweight interaction.

sex = F:

IOTF_pOWcutoff_c100	IOTF_pOWcutoff_c100.trend	SE	df	asympt.LCL	asympt.UCL
17	0.02370	0.01158	Inf	0.00101	0.0464

sex = M:

IOTF_pOWcutoff_c100	IOTF_pOWcutoff_c100.trend	SE	df	asympt.LCL	asympt.UCL
17	-0.00632	0.00867	Inf	-0.02332	0.0107

Results are averaged over the levels of: Month_AED

Confidence level used: 0.95

For females, a female child with 110% of overweight cutoff would have 1.27 times the odds of experiencing elevated peer problems than a female child with 100% of overweight cutoff. There was no association between percent of overweight cutoff and odds of peer problems in males.

6.3 Prosocial

Considerate of other people's feelings

Shares readily with other children

Helpful if someone is hurt

Kind to younger children

Often volunteers to help others

Table 18: Logistic Model: Prosocial Problems (Low vs Not) - SES category + Maternal Education + Age + Sex + pOWcutoff
