## 1 Measurement of Weight Status

We decided to use the International Obesity Task Force (IOTF) designation of weight status for the sample. They use smoothed, sex-specific BMI curves meant to match the BMI cutoffs for overweight (OW; 25  $kg/m^2$ ) and obesity (OB; 30  $kg/m^2$ ) at age 18 yrs.

Rather than BMI-zscore or BMI-percentile, we chose to use percent of overweight cutoff because recent studies shows it has a tighter association with measured adiposity:

BMI % of overweight = 
$$\frac{childBMI}{BMI \text{ at age-} \text{ and } sex-} \frac{childBMI}{adjusted \text{ overweight } cutoff} * 100$$

 $<\!100~\%$  - indicates child BMI is below the overweight cutoff for age and sex (i.e., has healthy weight) 100 % - indicates child BMI is the same as the overweight cutoff for age and sex  $>\!100~\%$  - indicates child BMI is above the overweight cutoff for age and sex (i.e., has overweight or obesity)

# Distribution of Percent of Overweight Cuttoff 1.020 1.015 1.010 1.005 1.000 Percent of IOTF Overweight Cuttoff

Density plot of percent of overweight by sex. The shaded regions indicated those with healthy weight (blue), overweight (yellow), and obesity (red). The points show density of participants by sex (purple circles = female, orange triangles = males).

# 2 Participant Characteristics

Table 1: Demographic Characteristics by Weight Status

Characteristic	N	HW, $N = 41$	OW, N = 29	OB, N = 37

## 2.1 Associations between Demographics and Percent of Overweight Cutoff

#### 2.1.1 t-test for sex

Welch Two Sample t-test

#### 2.1.2 Correlation Matrix

Table 2: Correlations between percent of overweight cuttoff and demographic characteristics

	Age_yr	Father_ed	Mother_ed	IOTF_pOWcutoff
$Age\_yr$				
$Father\_ed$	-0.02			
$Mother\_ed$	-0.2*	0.51*		
IOTF_pOWcutoff	0.26*	-0.07	-0.15	

Table 3: P-vales for the correlations between percent of overweight cuttoff and demographic characteristics

	Age_yr	Father_ed	Mother_ed	IOTF_pOWcutoff
$Age\_yr$				
$Father\_ed$	0.806			
$Mother\_ed$	0.049	0		
IOTF_pOWcutoff	0.006	0.491	0.131	

Only child age was associated with percent of overweight cutoff - older children tended to have higher percent of overweight cutoff indicating older children were more likely to have overweight or obesity. There was no association with father or mother education level, which differs from finding in the US. Hip to waist ratio was also not associated with percent of overweight cutoff.

#### 2.1.3 One-Way ANOVA for Income Categories

Residuals 136638 95

Anova Table (Type III tests)

Signif. codes: 0 '\*\*\*' 0.001 '\*\*' 0.01 '\*' 0.05 '.' 0.1 ' ' 1

There was no difference in percent of overweight by monthly income category.

## 2.1.4 Sensitivity Tests

Table 4: Linear Model: pOWcutoff - SES category + Maternal Education + Age + Sex

	b	se	t	p	
(Intercept)	71.310	27.957	2.551	0.012	
Month_AED25,000 - 55,000 AED	9.699	8.663	1.120	0.266	
Month_AED55,000 - 75,000 AED	19.268	16.747	1.150	0.253	
$Month\_AED > 75,000 AED$	2.047	15.847	0.129	0.898	
$Mother\_ed$	-1.654	1.254	-1.319	0.191	
$Age\_yr$	4.239	1.464	2.894	0.005	***
$\operatorname{sexM}$	10.293	7.621	1.351	0.180	

After controlling for family income, mother education, and child sex, child age was significantly associated with percent of overweight such that for each year older, the expected percent of overweight is predicted to increase 4.24%.

# 3 Medical Comorbidities

#### 3.2.3 Hyperlipidemia

Table 7: Hyperlipidemia Status by Weight Status

	HW	OW	ОВ
N	41	24	30
Y	0	5	7

Fisher's Exact Test for Count Data

data:

p-value = 0.004283

alternative hypothesis: two.sided

#### 3.2.4 Thyroid Conditions

Pearson's Chi-squared test

data: xtabs(~as.factor(ifelse(is.na(UAE\_allDat\$ThyroidConditions), "N", "Y")) + IOTF\_3class, data = 
X-squared = 1.8782, df = 2, p-value = 0.391

## 3.2.5 Glycemic Status

Pearson's Chi-squared test

data: xtabs(~as.factor(ifelse(is.na(UAE\_allDat\$GlycemicStatus), "N", "Y")) + IOTF\_3class, data = U.
X-squared = 3.8464, df = 2, p-value = 0.1461

### 3.3 Association between Comorbidities and Percent of Overweight Cutoff

#### 3.3.1 t-tests for Presence/Absence of Comorbidities

Table 8: t-tests for percent of overweight by absence vs presence of medical comorbidity

	AbsentMean	PresentMean	t	df	pvalue	sig
VitD Deficiency	114.56	114.84	-0.02	9.25	0.984	
Anemia	122.62	101.12	3.01	81.89	0.004	**
Thyroid Dysfunction	113.40	118.44	-0.59	39.42	0.559	
Glycemic Status	112.51	120.43	-0.86	39.25	0.393	

Table 9: Standard deviations for percent of overweight by absence vs presence of anemia

	X
N	35.677
Y	35.828

There were no difference in percent of overweight cutoff by presence/absence of Thyroid dysfunction or impaired glucose function. However, those with anemia tended to have lower percent of overweight. The mean with anemia was 101% indicating children were overweight on average. The mean for those without anemia were 123%, indicating the children were above the overweight cutoff.

# 4 Family History

Table 10: Family History by Weight Status

# 4.1 Association with Yes/No Family History

### 4.1.1 t-tests for Yes/No History of Obesity

Welch Two Sample t-test

data: IOTF\_pOWcutoff by Fam\_OB\_YN

t = 4.828, df = 87.915, p-value = 5.776e-06

alternative hypothesis: true difference in means is not equal to 0

95 percent confidence interval:

17.83736 42.79491

 ${\tt sample estimates:}$ 

mean in group yes mean in group no 125.08610 94.76996

Table 11: Standard deviations for percent of overweight by absence vs presence of family history of obesity

	X
yes	38.383
no	23.871

There was no differences in percent of overweight for those whose families had a history of eating disorder (reported by parent). There was a significant difference in percent of overweight between families that reported a history of obesity ('Yes') and those who did not ('No'). Those without a family history of obesity had a mean percent of overweight equal to 94%, indicating the children had healthy weight on average. Children with a family history of obesity had a mean percent of overweight equal to 124%, indicating the children had overweight or obesity.

### 4.1.2 distribution test for Yes/Now History of Eating Disorders across Weight Status

Fisher's Exact Test for Count Data

data: xtabs(~IOTF\_3class + Fam\_ED\_YN, data = UAE\_allDat)

p-value = 0.2633

alternative hypothesis: two.sided

## 4.2 Family Members with History of Obesity

Table 12: Overall Family Relationship Categories with History of Obeisty

Characteristic	N	N = 107
Mother Father	107 107	18 (17%) 21 (20%)
Grandmother	107	33 (31%)
Grandfather Sister	$\frac{107}{107}$	6 (5.6%) 16 (15%)
Brother	107	25 (23%)
Aunt	107	45 (42%)
Uncle	107	29 (27%)

<sup>&</sup>lt;sup>1</sup> n (%)

#### 4.2.1 mean (sd) number of family relationship categories

[1] 1.803738

[1] 1.750683

#### 4.2.2 Correlations with Number of Relative Categories with History of Obesity

Pearson's product-moment correlation

data: UAE\_allDatnFam\_obesityandUAE\_allDatIOTF\_pOWcutoff t = 4.8557, df = 105, p-value = 4.201e-06 alternative hypothesis: true correlation is not equal to 0 95 percent confidence interval:  $0.2594553 \ 0.5716059$  sample estimates: cor 0.4282197

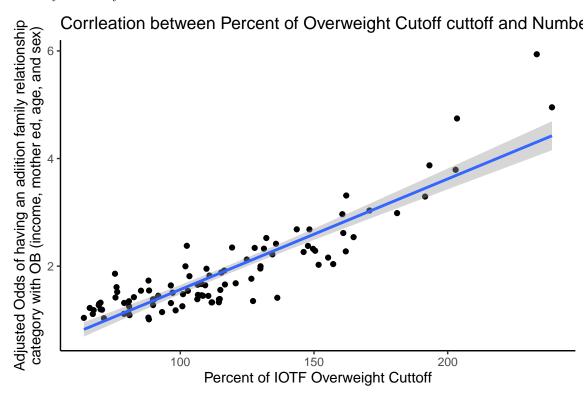

Percent of overweight cutoff was not associated with reported number of relative categories with an perceived to have had an eating disorder but was associated with family history of obesity.

#### 4.2.3 Sensitivity Tests

Table 13: Linear Model: Peer Problems (raw) - SES category + Maternal Education + Age + Sex + pOWcutoff

	b	e^b	se	e^2.5 CI	e^97.5 CI	Z	p	
(Intercept)	-0.180	0.835	0.577	0.266	2.558	-0.313	0.754	
Month_AED25,000 - 55,000 AED	0.113	1.120	0.182	0.788	1.610	0.622	0.534	
Month_AED55,000 - 75,000 AED	0.380	1.462	0.307	0.779	2.611	1.239	0.215	
$Month\_AED > 75,000 AED$	-0.127	0.880	0.372	0.404	1.761	-0.342	0.732	
$Mother\_ed$	-0.029	0.971	0.024	0.928	1.019	-1.221	0.222	
$Age\_yr$	0.011	1.011	0.031	0.950	1.075	0.335	0.738	
$\operatorname{sexM}$	-0.111	0.895	0.159	0.654	1.218	-0.703	0.482	
$IOTF\_pOWcutoff$	0.008	1.008	0.002	1.005	1.012	4.360	0.000	***

After controlling for family income, mother education, child age, and child sex, percent of overweight showed a trend-level association with number of family members with history of obesity. A child with 110% of overweight, compared to 100%, would have 1.08 times the odds of having an additional family member with a history of obesity.

## 4.3 Family Members with History of Eating Disorders

Table 14: Overall Family Relationship Categories with History of Eating Disorders

## 5.1 Association Betwen Sleep Sub-Scales and Percent of Overweight Cutoff

#### 5.1.1 Correlation Matrix

Table 16: Correlations between sleep subscales and percent of overweight

	IOTF_pOWcutoff	Bed_hr	$\operatorname{BedResit}$	OnsetDelay	Duration	Anxiety	NightWaking	Paras
IOTF_pOWcutoff								
$\operatorname{Bed}_{-}\operatorname{hr}$	-0.09							
$\operatorname{BedResit}$	-0.13	0.01						
OnsetDelay	0.31*	-0.11	0.13					
Duration	0.04	-0.34*	0.41*	0.4*				
Anxiety	-0.18	0.24*	0.62*	-0.1	0.02			
NightWaking	0.05	0.12	0.21	0.05	0.29*	0.23*		
Parasomnias	0.04	0.06	0.17	0.02	0.04	0.12	0.41*	
DisorderBreathing	0.32*	0.02	0.25*	0.04	0.07	0.19	0.36*	0.45*
DaySleepiness	-0.04	0.09	0.28*	0.16	0.21	0.28*	0.05	0.18

Examining correlations between sleep sub-scales and percent of overweight cutoff reveals greater percent of overweight cutoff was associated with greater parent reported sleep onset delay and sleep disordered breathing.

**5.1.2.1** Sleep Onset Delay After controlling for family income, mother education, child age, and child sex, percent of overweight was positively associated with sleep onset delay such that a child with 110% of overweight, compared to 100% of overweight, would be expected to have a sleep onset delay score that was 0.06 points higher (range of scores = 0 - 3). Additionally, age was positively associated with sleep onset delay such that each year older, the expected sleep disordered breathing score would be 0.12 points higher (range of scores = 0 - 7).

## Association between Percent of Overweight Cutoff and Sleep Onse

$sexM:IOTF\_pOWcutoff\_c100$	-0.030	0.970	0.014	0.942	0.997	-2.098	0.036	*

When examining odds of experiencing elevated peer problems, controlling for family income, mother education, child age, and child sex, percent of overweight, there was a significant sex x percent of overweight interaction.

Results are averaged over the levels of: Month\_AED Confidence level used: 0.95

For females, a female child with 110% of overweight cutoff would have 1.27 times the odds of experiencing elevate peer problems than a female child with 100% of overweight cutoff. There was no association between percent of overweight cutoff and odds of peer problems in males.

#### 6.3 Prosocial

Considerate of other people's feelings

Shares readily with other children

Helpful if someone is hurt

Kind to younger children

Often volunteers to help others
